The science of combustion is focused on obtaining basic descriptions of combustion phenomena by experimental and mathematical methods. The principles are sufficiently well developed that the subject qualifies as an applied science. Unwanted fires involve specifically the combustion of available fuels in air.

The results of experimental study on excess-air-dependent heat losses and gaseous emissions (NO x, SO 2 and CO) for a 310 MW fuel oil-fired boiler operating at full and reduced (75 and 50%) loads, are discussed. For the 100% boiler load, data on NO x emissions indicate the formation of thermal NO along with the fuel and prompt NO. The material balance for SO x points out the minor formation of ...
